

BCS-2[®] Multimasking-Modul

Brief description

BCS-2[®] offers the possibility of defining multiple rectangular masks based on the format, color depth and orientation of the scans.

These tiles are basically clippings from the original image can be transformed into new images or have their content replaced with the contents of another mask.

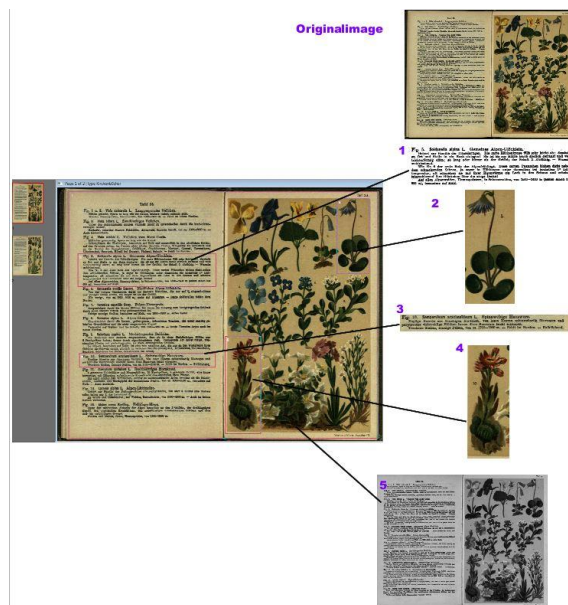

Areas of Application

For each tile a number of post processing operations can be stored:

- Adapt color depth
- Assign new file format
- Provided the corresponding optional modules have been licensed, following applications are possible:
 - OCR of roman and gothic fonts with the OCR Module
 - Barcode recognition with the Barcode Module
 - Image post processing options such as individually watermarking the images with the electronic endorser, adapt format as well as any image post-processing with the batch module

Advantages and Functions

- Evenly crop single and double pages
- Creation of image clippings while retaining the original image
- Image sequence is individually adjustable

Example for the export of tiles
