

Web Publisher with FTP Module

Brief Description

The BCS-2[®] web publisher allows for quick delivery of scanned documents. The documents are made available on a web server in HTML directly from BCS-2[®] and are accessible through a hyperlink. The user is sent the hyperlink by an automatically generated email and may decide when to access the documents or copy them from the internet to his or her local system. The documents can be displayed using any standard browser (Firefox, Internet Explorer, Opera, etc.) by clicking the hyperlink. The selected picture appears in the main frame. The remaining pictures including the order information are displayed as thumbnails left of the main frame in the status bar.

Areas of Application

- Document delivery services for books and magazine articles
- Local scanning at multiple locations, especially relevant for businesses and public institutions with distributed locations and central archiving, e.g. central controlling
- Publishing documents on the internet and/or intranet
- Scanning on demand at distributed archives and registries

Advantages and Functions

- Less overhead through relieving the in and out mailboxes
- Singular transfer of documents even in preparation for multiple recipients
- The availability of the documents is separate from the access time and location of the scanner
- The "WWW" function integrated, since 2013, in the BCS-2[®] basic version and available in the order list. With this function the entire document is converted to the defined format (TIFF, JPEG, PNG etc.) and is then embedded in HTML-Code (corresponding to the pre-adjusted settings). It is then deposited per transfer (FTP, SFTP) to a web server defined by the user. At the same time, an E-mail with the shortcut ("hyperlink") is generated with MAPI or SMTP with which the user may view the document at any time.
